Date: 10th October, 2020

Title: 8-Puzzle Problem using A* Algorithm

Problem Definition:

Solve 8-puzzle problem using A* algorithm. Assume any initial configuration and define goal configuration clearly.

Learning Objectives:

- Learn Informed Search Algorithms
- Learn A* Algorithm and its application
- Learn about 8 puzzle problem
- To define Perception, Cognition, Action and Goal clearly

Learning Outcomes:

I will be able to design A* algorithm to solve the 8 puzzle problem.

S/W & H/W Packages:

1. Operating System: 64-bit Open source Linux or its derivative
2. Programming Language: Python3
3. Google Colaboratory(uses Tesla K80 GPU)

Related Mathematics:

Programmer's Perspective

Let S be the system set:

$S = \{s; e; X; Y; Fme; DD; NDD; Fc; Sc\}$

s=start state

e=end state

X=input state

$X = \{X1\}$

where,

X1 = start state

Y = goal state

Fme is the set of main functions

$Fme = \{f1, f2, f3\}$

where,

f1 = initializer

f2 = function to calculate distance

f3 = function to create children nodes

f4 = function to solve puzzle using A* Algorithm

DD= Deterministic Data

NDD=Non-deterministic data: No non deterministic data

Fc=failure case: If start and goal state do not match

Concepts Related to Theory:

8-puzzle Problem

- 8 puzzle is a popular puzzle that consists of 8 tiles and one empty space.
- The puzzle is divided into 3 rows and 3 columns.
- The other 8 tiles have numbers 1 through 8 on it

- The puzzle can be solved by moving the tiles one by one in the single empty space and thus achieving the Goal State.

Perception

- We visualize swapping the empty space with its neighbors
- The empty tile can have 9 possible locations.
- $\exists x.(\text{move}(x) \wedge \text{valid location}(x))$
- The empty space can only move in four directions (Movement of empty space) $\forall x.(\text{shuffle}(x) \wedge \text{valid}(x) \rightarrow \text{open list}(x))$
 - Up
 - Down
 - Right
 - Left
- The empty space cannot move diagonally and can take only one step at a time.
- $\exists x.(\text{move}(x) \rightarrow \sim \text{diagonal}(x))$

Cognition

$$f(n) = g(n) + h(n)$$

Cost of A* Algorithm: $f(n) = g(n) + h(n)$

- $g(n)$ is the cost of the path traversed from the initial state to node n .
- $h(n)$ is the estimated path-cost or the heuristic function cost from node n to the goal node. $g(n) = \text{Path Cost}$
- Each step costs 1, so the path cost is the number of steps in the path.

For any 8-puzzle's tile

- $\text{Misplaced}(i) = \{ ((x1_i = x2_i) \& (y1_i = y2_i)) \mid \forall x1_i, y1_i, x2_i, y2_i \in \{0,1,2\} \}$
- Where,
- $(x1_i, y1_i)$ is the coordinate of the tile with number i in current state
- $(x2_i, y2_i)$ is the coordinate of the tile with number i in goal state
- $x1_i, y1_i, x2_i, y2_i \in \{0,1,2\}$
- $i \in \{0,1,2,3,4,5,6,7,8\}$

- $h(n) = \text{Misplaced}(i)$ for $0 \leq i \leq 8$

Action

Action = {U, L, D, R}

- Action can be represented as a set of 4
- Each Action represents the interchanging of blank tile with the neighbor in one of the 4 directions.
 - Up (U)
 - Down (D)
 - Right (R)
 - Left (L)
- Constraints
 - The neighbor should not be diagonally adjacent
 - The edge positions can interchange in only three directions
 - The corner positions can interchange in only two directions
 - Interchanging takes place one step at a time $f_{min} = \min(f_1, f_2, \dots, f_m)$
- Choose the heuristic function with the minimum f-value ◦ Where m is the number of states

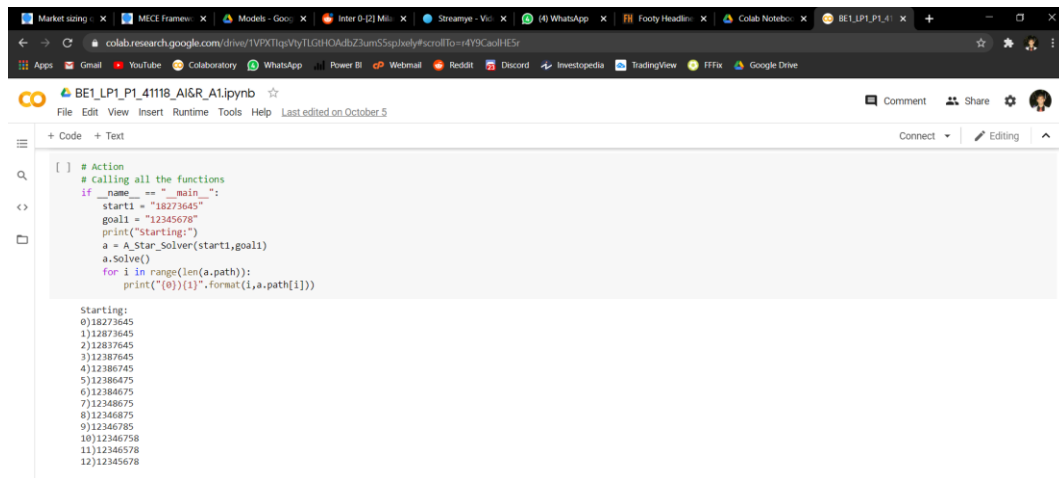

Steps for Execution:

1. Open Google Colaboratory
2. Write code for A* Algorithm
3. Define start and goal states
4. Run the code

Notebook Link:

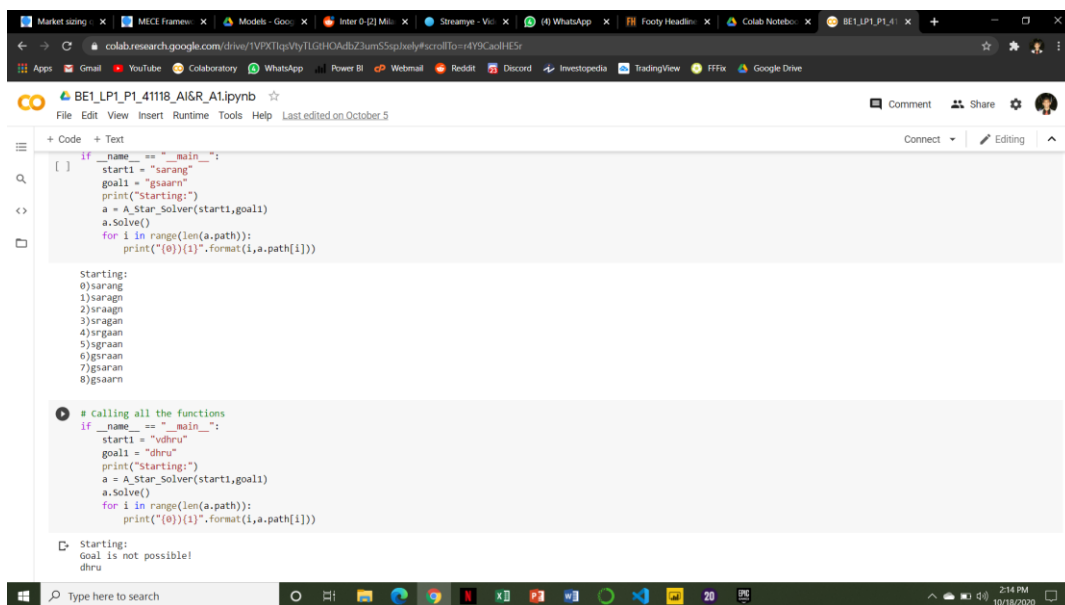

<https://colab.research.google.com/drive/1VPXTlqsVtyTLGtHOAdbZ3umS5spJxely?usp=sharing>

Output:

```
[ ] # Action
# calling all the functions
if __name__ == "__main__":
    start1 = "18273645"
    goal1 = "12345678"
    print("Starting:")
    a = A_Star_Solver(start1,goal1)
    a.Solve()
    for i in range(len(a.path)):
        print("{}(i)".format(i),a.path[i]))

Starting:
0)18273645
1)12873645
2)12873645
3)12387645
4)12386745
5)1238675
6)12384675
7)12348675
8)12346875
9)12346785
10)12346758
11)12346578
12)12345678
```

```
[ ] if __name__ == "__main__":
    start1 = "sarang"
    goal1 = "gsaarn"
    print("Starting:")
    a = A_Star_Solver(start1,goal1)
    a.Solve()
    for i in range(len(a.path)):
        print("{}(i)".format(i),a.path[i]))

Starting:
0)sarang
1)saragn
2)sraagn
3)sragan
4)srgaan
5)sgraan
6)gsraan
7)gsaran
8)gsaarn

# Calling all the functions
if __name__ == "__main__":
    start1 = "vdhru"
    goal1 = "dhru"
    print("Starting:")
    a = A_Star_Solver(start1,goal1)
    a.Solve()
    for i in range(len(a.path)):
        print("{}(i)".format(i),a.path[i]))

Starting:
Goal is not possible!
dhru
```

Conclusion:

I have successfully designed A* search algorithm for 8 puzzle and defined Perception, Cognition, Action and Goal for the same.
